GUIDANCE FOR AUTHORS

Aims and Scope *Biodiversitas*, *Journal of Biological Diversity* or abbreviated as *Biodiversitas* encourages submission of manuscripts dealing with all biodiversity aspects of plants, animals and microbes at the level of the gene, species, and ecosystem as well as ethnobiology.

Article types The journal seeks original full-length research papers, reviews, and short communication. Manuscript of original research should be written in no more than 8,000 words (including tables and picture), or proportional with articles in this publication number. Review articles will be accommodated, while, short communication should be written at least 2,000 words, except for pre-study.

Submission The journal only accepts online submission, through open journal system (<https://smujo.id/biodiv/about/submissions>) or email to the editors at unsjournals@gmail.com. Submitted manuscripts should be the original works of the author(s). The manuscript must be accompanied by a cover letter containing the article title, the first name and last name of all the authors, a paragraph describing the claimed novelty of the findings versus current knowledge. Submission of a manuscript implies that the submitted work has not been published before (except as part of a thesis or report, or abstract); and is not being considered for publication elsewhere. When a manuscript written by a group, all authors should read and approve the final version of the submitted manuscript and its revision; and agree the submission of manuscripts for this journal. All authors should have made substantial contributions to the concept and design of the research, acquisition of the data and its analysis; drafting of the manuscript and correcting of the revision. All authors must be responsible for the quality, accuracy, and ethics of the work.

Ethics Author(s) must obedient to the law and/or ethics in treating the object of research and pay attention to the legality of material sources and intellectual property rights.

Copyright If and when the manuscript is accepted for publication, the author(s) still hold the copyright and retain publishing rights without restrictions. Authors or others are allowed to multiply article as long as not for commercial purposes. For the new invention, authors are suggested to manage its patent before published.

Open access The journal is committed to free-open access that does not charge readers or their institutions for access. Readers are entitled to read, download, copy, distribute, print, search, or link to the full texts of articles, as long as not for commercial purposes. The license type is CC-BY-NC-SA.

Acceptance The only articles written in English (U.S. English) are accepted for publication. Manuscripts will be reviewed by editors and invited reviewers(double blind review) according to their disciplines. Authors will generally be notified of acceptance, rejection, or need for revision within 1 to 2 months of receipt. The manuscript is rejected if the content does not in line with the journal scope, does not meet the standard quality, inappropriate format, complicated grammar, dishonesty (i.e. plagiarism, duplicate publications, fabrication of data, citations manipulation, etc.), or ignoring correspondence in three months. The primary criteria for publication are scientific quality and biodiversity significance. **Uncorrected proofs** will be sent to the corresponding author by email as *.doc* or *.docx* files for checking and correcting of typographical errors. To avoid delay in publication, corrected proofs should be returned in 7 days. The accepted papers will be published online in a chronological order at any time, but printed in the early of each month (12 times).

A charge Starting on January 1, 2019, publishing costs waiver is granted to authors of graduate students from **Least Developed Countries**, who first publish the manuscript in this journal. However, other authors are charged USD 250 (IDR 3,500,000). Additional charges may be billed for language editing, USD 75-150 (IDR 1,000,000-2,000,000).

Reprints The sample journal reprint is only available by special request. Additional copies may be purchased when ordering by sending back the uncorrected proofs by email.

Manuscript preparation Manuscript is typed on A4 (210x297 mm²) paper size, in a single column, single space, 10-point (10 pt) Times New Roman font. The margin text is 3 cm from the top, 2 cm from the bottom, and 1.8 cm from the left and right. Smaller lettering size can be applied in presenting table and figure (9 pt). Word processing program or additional software can be used, however, it must be PC compatible and Microsoft Word based (*.doc* or *.rtf*; not *.docx*). **Scientific names** of species (incl. subspecies, variety, etc.) should be written in italic, except for italic sentence. Scientific name (genera, species, author), and cultivar or strain should be mentioned completely for the first time mentioning it in the body text, especially for taxonomic manuscripts. Name of genera can be shortened after first mentioning, except generating confusion. Name of the author can be eliminated after first mentioning. For example, *Rhizopus oryzae* L. UICC 524, hereinafter can be written as *R. oryzae* UICC 524. Using trivial name should be avoided, otherwise generating confusion. **Biochemical and chemical nomenclature** should follow the order of the IUPAC - IUB. For DNA sequence, it is better used Courier New font. Symbols of standard chemical and abbreviation of chemistry name can be applied for common and clear used, for example, completely written butilic hydroxyl toluene (BHT) to be BHT hereinafter. **Metric measurement** use IS denomination, usage other system should follow the value of equivalent with the denomination of IS first mentioning. Abbreviations set of, like g, mg, mL, etc. do not follow by dot. Minus index (m⁻², L⁻¹, h⁻¹) suggested to be used, except in things like "per-plant" or "per-plot". **Equation of mathematics** does not always can be written

down in one column with text, in that case can be written separately. **Number** one to ten are expressed with words, except if it relates to measurement, while values above them written in number, except in early sentence. The fraction should be expressed in decimal. In the text, it should be used "%" rather than "percent". Avoid expressing ideas with complicated sentence and verbiage, and used efficient and effective sentence.

Title of the article should be written in compact, clear, and informative sentence, preferably not more than 20 words. Name of author(s) should be completely written. **Name and institution** address should also be completely written with street name and number (location), postal code, telephone number, facsimile number, and email address. Manuscript written by a group, author for correspondence along with address is required. First page of the manuscript is used for writing above information.

Abstract should not be more than 200 words. **Keywords** is about five words, covering scientific and local name (if any), research theme, and special methods which used; and sorted from A to Z. All important **abbreviations** must be defined at their first mention. **Running title** is about five words. **Introduction** is about 400-600 words, covering the background and aims of the research. **Materials and Methods** should emphasize on the procedures and data analysis. **Results and Discussion** should be written as a series of connecting sentences, however, for manuscript with long discussion should be divided into subtitles. Thorough discussion represents the causal effect mainly explains for why and how the results of the research were taken place, and do not only re-express the mentioned results in the form of sentences. **Concluding** sentence should be given at the end of the discussion. **Acknowledgments** are expressed in a brief; all sources of institutional, private and corporate financial support for the work must be fully acknowledged, and any potential conflicts of interest are noted.

Figures and Tables of maximum of three pages should be clearly presented. Title of a picture is written down below the picture, while title of a table is written above the table. Colored figures can only be accepted if the information in the manuscript can lose without those images; chart is preferred to use black and white images. Author could consign any picture or photo for the front cover, although it does not print in the manuscript. All images property of others should be mentioned source. **There is no appendix**, all data or data analysis are incorporated into Results and Discussions. For broad data, it can be displayed on the website as a supplement.

References Author-year citations are required. In the text give the authors name followed by the year of publication and arrange from oldest to newest and from A to Z. In citing an article written by two authors, both of them should be mentioned, however, for three and more authors only the first author is mentioned followed by et al., for example: Saharjo and Nurhayati (2006) or (Boonkerd 2003a, b, c; Sugiyarto 2004; El-Bana and Nijs 2005; Balagadde et al. 2008; Webb et al. 2008). Extent citation as shown with word "*cit*" should be avoided. Reference to unpublished data and personal communication should not appear in the list but should be cited in the text only (e.g., Rifai MA 2007, pers. com. (personal communication); Setyawan AD 2007, unpublished data). In the reference list, the references should be listed in an alphabetical order (better, if only 20 for research papers). Names of journals should be abbreviated. Always use the standard abbreviation of a journal's name according to the **ISSN List of Title Word Abbreviations** (www.issn.org/2-22661-LTWA-online.php). The following examples are for guidance.

Abstract. Putra AN, Mustahal, Syamsunarno MB, Hermawan D, Fatimah DG, Putri PB, Sevia, Isnaini R, Herjayanto M. 2021. Dietary *Bacillus* NP5 supplement impacts on growth, nutrient digestibility, immune response, and resistance to *Aeromonas hydrophila* infection of African Catfish, *Clarias gariepinus*. *Biodiversitas* 22: 253-261. This study aims to investigate the effects of *Bacillus* NP5 supplementation as a probiotic on growth, immune response, and resistance of African catfish to *Aeromonas hydrophila* infection. Catfish with an initial weight of 6.8 ± 0.1 g were fed with different doses of *Bacillus* NP5 (0%, 1.1%, 1.2% B, 1.3%, and 1.4%) with three replications and reared for 60 days. The first 45 days were used to observed growth performance, and the last 15 days were used to perform challenge tests against *A. hydrophila* infection. The results showed that the treatment of 1.2% *Bacillus* NP5 results in the highest specific growth rate (2.55 ± 0.28 day⁻¹) and increased protein and lipid digestibility significantly ($P < 0.05$). Treatment of 1.1-1.3% *Bacillus* NP5 increase amylase and lipase activity that significantly higher than 0% *Bacillus* NP5 treatment. Supplementation of *Bacillus* NP5 significantly increased the leukocyte, phagocytic index, and survival rate in African catfish after *A. hydrophila* infection. Therefore, the supplementation of 1.2% *Bacillus* NP5 in the feed increased the growth, immune response, and African catfish resistance to the infection.

Keywords: African catfish, *Bacillus* NP5, growth, probiotic, response immune

INTRODUCTION

Indonesia is the second-largest producer of aquaculture products in the world after China, with a total of 9.3 million tons in 2018 (FAO 2020). African catfish (*Clarias gariepinus*) is one of the common commodities found in its freshwater fishery. According to the Ministry of Marine Affairs and Fisheries (2019), catfish production in Indonesia was the 3rd largest after shrimp and tilapia, with a total production of 19.6 thousand tons in 2017. Catfish farming has been intensively and sustainably carried out to fulfill the increasing demand for fish. Zhang et al. (2018) stated that various negative impacts, such as the emergence of disease attacks, decrease in environmental quality, and retardation of fish growth, are associated with the intensification of aquaculture. *Aeromonas hydrophila* is an opportunistic gram-negative bacterium. It causes Motile *Aeromonas* Septicemia (MAS) in fish (Korni and Khalil 2017; Shoemaker et al. 2018), which leads to an increase in mortality rate (Maji et al. 2017; Jung-Schroers et al. 2018; Li et al. 2019a). Over the past few decades, fish farmers have adopted the use of antibiotics, a conventional method to control disease attacks (Lee et al. 2019). However, antibiotics and other chemical compounds lead to the improvement of resistance in pathogenic bacteria (Hoseinifar et al. 2018) and increase chemical residues in

water and fish (Lee et al. 2016; Hassani et al. 2019). Therefore, an environmentally friendly approach is needed to overcome the problems in aquaculture intensification to maintain sustainability.

Probiotics are environmentally friendly applications to improve fish health and growth (Carnevali et al. 2017). According to Ramesh et al. (2015), it is a substitute for antibiotics and can suppress pathogens' growth without being detrimental to the host and its environment. Furthermore, Li et al. (2019b) reported that it has been widely applied in aquaculture and used as a substitute for fish and shrimp antibiotics. Previous studies showed that probiotics supplementation in aquaculture results in increasing growth and feed digestibility. Probiotics increase digestive enzyme activity (Enferadi et al. 2018; Valiallahi et al. 2018; Arani et al. 2019), increase immunity against pathogens (Amir et al. 2019; Zhu et al. 2019), and improve the water quality of culture media (Elsabagh et al. 2018; Kewcharoen and Srisapoom 2019).

Bacillus NP5 is a Gram-positive bacteria, oxidation fermentation, and catalase-positive (Putra and Widanarni 2015). Previous studies showed that supplementation of *Bacillus* NP5 in fish increase growth (Putra et al. 2015; Utami et al. 2015), increase immunity against fish pathogens (Widanarni et al. 2014; Febrianti et al. 2016; Tamamdusturi et al. 2016) and improve water quality

(Putra et al. 2020a). The addition of 1% and 1.5% of *Bacillus* NP5 results in increasing African catfish' growth performance (Putra et al. 2020b). In this study, a probiotic dose range of 1-1.5% was used to obtain the correct dose of *B. NP5* in the diet. Besides, there were still a few data related to the effect of *Bacillus* NP5 addition to catfish's immune system. Therefore, this study was carried out to investigate *Bacillus* NP5 probiotics' supplementation on growth performance, immune response, and African catfish resistance to *A. hydrophila* infection.

MATERIALS AND METHODS

Probiotic and feed preparation

Bacillus NP5 is a probiotic bacteria originating from the intestine of *Oreochromis niloticus* (Putra and Widanarni 2015). Bacteria were cultured according to the method by Putra and Romdhonah (2019). *Bacillus* NP5 was cultured aseptically in 250 mL of tryptic soy broth (TSB) medium and incubated for 18 hours at room temperature. After incubation, the bacterial culture was centrifuged (HITACHI himac CT6E/CT6EL) at the speed of 1000 \times g for 10 minutes at 4°C, and the bacterial supernatant was washed and homogenized by adding 100 mL of phosphate buffer saline (PBS, pH 7.2). Furthermore, serial dilutions with PBS were carried out to obtain a 10⁶ CFU/mL bacterial density. Bacterial supernatant was stored at 4°C before being mixed in the feed.

Commercial catfish feed (781, INDONESIA) was used as a basal diet grounded into flour, sieved with 320 μ m mesh, and thoroughly mixed with chromium oxide of 0.5% as the digestibility indicator and 3% tapioca as a binder. Then, 30% of warm water was added and printed in a 1-2 mm feed diameter in a pellet machine. Subsequently, the feed was oven heated at 50°C for 24 hours, followed by homogenization of 2% egg yolk (Putra et al. 2015) and sprayed with *Bacillus* NP5 supernatant according to the treatment dose. The proximate composition of the experimental diet is presented in Table 1.

Table 1. Proximate composition (g/100 g feed) of experimental diet

Proximate	Value
Crude protein (%)	33.95
Crude lipid (%)	7.73
Crude fiber (%)	4.16
Ash (%)	9.9
Moisture (%)	6.49
Organic matter (%)*	83.61
Nitrogen-free extracts**	37.77
Dry matter (%)	93.51
Energy (Kcal g feed ⁻¹)***	275.863
Size feed (mm)	1-2

Note: *Dry weight – ash, **100 - protein-lipid - fiber - ash – moisture, ***Digestible energy according to NRC (1993), calculated as protein 118.8 Kcal g feed⁻¹; lipid 62.6 Kcal g feed⁻¹, and carbohydrate: 94.4 Kcal g feed⁻¹

Fish rearing and experimental procedure

A total of 375 African catfish obtained from the Baros Seed Center, Serang, Indonesia, were used in this study. Fish rearing was carried out at the Laboratory of Aquaculture, University of Sultan Ageng Tirtayasa, Indonesia. The initial weight of the catfish was 6.8 ± 0.1 g were randomly scattered into the round tank with a diameter of 72 cm diameter and fish density of 25 fish /tank with a water volume of 40 L. The aerator was placed at the center of the tank at 15 cm from the bottom. The acclimatization process was carried out for seven days, and the fish was unfed for 24 hours before treatment. Feeding was carried out three times daily, i.e., at 08.00, 12.00, and 17.00 Western Indonesian time zone through a satiation method. Approximately 20% of the total water volume was changed every three days and 50% every two weeks. The rearing process was carried out for 60 days, of which the first 45 days were used for growth tests and the remaining 15 days for a challenge test with the injection of the pathogen *A. hydrophila*.

A completely randomized design with five different levels of *Bacillus* NP5 probiotic (0% or negative control, 1.1%, 1.2%, 1.3%, and 1.4%) with three replications was used in this study. The in-situ water quality monitoring such as temperature (RESUN, Indonesia) was carried out daily, while pH (LUTRON 208) and dissolved oxygen (LUTRON DO550) were observed weekly. Ammonia measurements were carried out based on the standard Phenate method (APHA 1998) at the beginning and the end of the rearing period. In the present study, water temperature was in the range of 27.1-28.8°C, while the pH value during rearing before and after water change was 5.17-7.23. The dissolved oxygen was 5.17-7.23 mg L⁻¹, while the ammonia value was below 2 mg L⁻¹. The value of water quality showed that it was in the normal range for catfish farming, according to Bhatnagar and Devi (2013).

Growth parameters

The number and weight of African catfish were measured at the beginning and the 45 days to determine the growth performance, which was calculated based on the equation proposed by Huisman (1987) as follow: (i) Feed intake (g) = the initial weight of feed – final weight of feed. (ii) Specific growth rate (% day⁻¹) = $100 \times ((\ln \text{ final weight of catfish} - \ln \text{ initial weight of catfish}) / 50 \text{ days})$. (iii) Feed conversion ratio = Total feed consumption / (final weight of catfish – the initial weight of catfish). (iv) Survival rate (%) = $100 \times (\text{final number of catfish} / \text{initial number of catfish})$

Collection of feces was carried out 2 hours after feeding by shipon from the 7th day until the treatment was complete. Feces was stored at -4°C. Nutrient digestibility was calculated based on the equation proposed by Takeuchi (1988) as follows: (i) Dry matter digestibility (%) = $100 \times (1 - (\% \text{ chromium content in the diet} / \% \text{ chromium content in the feces}))$. (ii) Protein/lipid digestibility (%) = $100 \times (1 - ((\% \text{ chromium content in the diet} / \% \text{ chromium content in the feces}) \times (\% \text{ nutrient content in the feces} / \% \text{ nutrient content in the feed})))$

Digestive enzyme activity was determined on day 45. A total of 5 fish from each treatment were randomly selected, and their total intestines (anterior and posterior) were surgically removed and weighed. The intestinal samples were crushed to obtain the substrate. The Bergmeyer et al. (1983) method was used to determine the protease activity with casein as a substrate in 0.05 M phosphate buffer, pH 7, and 5 mmol/L of tyrosine. Amylase activity was determined using 1% starch solution as a substrate in 20 mM sodium phosphate buffer, pH 6.9, and 20 mM of sodium phosphate according to the method by Worthington (1993). Lipid enzyme activity was calculated based on the procedure described by Borlongan (1990), using olive oil as a substrate and Tris-HCL as a buffer.

Chemical analysis

Proximate analysis of feed and fish was carried out using the standard method of AOAC (2005). A total of 5 catfish were randomly selected for analysis with the micro-Kjeldahl method to determine crude protein content. Moisture was estimated with an oven at 105°C for 6 hours, while the sample was analyzed through extraction with a Soxhlet to determine crude lipid content. The percentage of ash was determined by combustion at 550 °C for 24 hours, and crude fiber was estimated by an Automatic analyzer.

Experimental infection

Aeromonas hydrophila was obtained from the Fish Health Laboratory of IPB University for challenge tests carried out on the 45th day. Before the challenge test, Koch's Postulates were performed to increase the virulence of *A. hydrophila*. Catfish were reared according to the treatment, and the fish density was uniform (15 individuals/tank). Meanwhile, *A. hydrophila* were cultured on 200 ml of TSB media for 24 hours and incubated at 29 °C. After incubation, the culture was centrifuged at 1000 x g for 10 minutes and diluted using PBS (pH: 7.2) to obtain 10⁷ CFU/mL density. Furthermore, it was injected intramuscularly into catfish as much as 0.1 mL per fish (Putra and Widanarni 2015).

Hematological and immune response

Evaluations of the hematological and immune response were carried out on days 0, 45, and 60. Five fish from each treatment were randomly selected to determine the number of erythrocytes and leukocytes according to the method by Blaxhall and Daisley (1973). Blood was mixed with Hayem's and Turk's solutions until it was homogeneous. Erythrocytes were counted using a Neubauer-type hemocytometer under a microscope with a magnification of 400x. Hematocrit level was calculated using a microhematocrit tube following the method by Anderson and Siwicki (1995). Determination of hemoglobin levels in the blood refers to Sahli's method (Wedemeyer and Yasutake 1977). Phagocytosis index was measured by mixing 20 µL of the blood sample with 20 µL of *A.*

hydrophila suspension as an antigen with a density of 10⁷ cells mL⁻¹. The phagocyte cells are counted based on the percentage during the phagocytosis process (Ispir and Dorucu 2005).

Statistical analysis

Data of growth and immune response were analyzed by Analysis of Variance (ANOVA) in Microsoft Office Professional Plus 2016. Duncan Multiple Range Test (DMRT) analyzed significant differences between treatments with a 95% confidence interval.

RESULTS AND DISCUSSION

Nutrient digestibility and digestive enzyme activity of African catfish

Table 2 showed that the dry matter digestibility in treatment 1.1-1.2% *Bacillus NP5* was significantly higher ($P < 0.05$) compared to 0% *Bacillus NP5*. However, the dry matter digestibility in the treatment of 1.3-1.4% *Bacillus NP5* was not significantly different compared to the control (0%) ($P > 0.05$). Treatment of 0% and 1.3% *Bacillus NP5* results in the lowest protein digestibility, while the highest was in 1.2% *Bacillus NP5* ($P < 0.05$) treatment. The lowest lipid digestibility was obtained from 0% and 1.4% *Bacillus NP5* treatment, and the highest one was in 1.1-1.3% *Bacillus NP5* ($P < 0.05$). Furthermore, the highest protease enzyme activity was obtained from 1.2% *Bacillus NP5*, significantly different from other treatments ($P < 0.05$). The highest amylase and lipase enzyme activity were obtained from 1.1-1.3% *Bacillus NP5* treatment.

Growth performance

The growth performance of catfish was presented in Table 3. The highest specific growth rate was in 1.2% *Bacillus NP5* treatment, which significantly different from other treatments ($P < 0.05$), while treatments of 0%, 1.1%, 1.3%, and 1.4% *Bacillus NP5* were not different. The final weights of 1.1-1.3% *Bacillus NP5* treatments were significantly higher than 0% *Bacillus NP5*. However, feed intake and survival rates in all treatments were not significantly different ($P > 0.05$). Furthermore, the highest feed conversion was obtained from 0% *Bacillus NP5* treatment, which was significantly different from the treatment of 1.1-1.4% *Bacillus NP5* ($P < 0.05$).

Whole-body composition

The whole-body composition of catfish was presented in Table 4. The highest crude protein was obtained from 1.2% *Bacillus NP5* treatment ($P < 0.05$). Crude lipids in treatments of 1.2-1.4% *Bacillus NP5* were significantly higher than 0-1.1% *Bacillus NP5* treatment. However, the application of *Bacillus NP5* does not have any effect on moisture and ash content ($P > 0.05$).

Hematological and immune response

Table 5 showed no significant difference in the values of blood profile and phagocyte index of African catfish on day 0. The same results were also obtained on day 45, except for the hematocrit value in the probiotic treatment, which was higher than the control ($P < 0.05$). At the end of rearing (day 60), the highest hemoglobin value was obtained from 1.2% *Bacillus* NP5, which was higher than other treatments ($P < 0.05$). Erythrocyte value in the treatment of 1.1, 1.2, and 1.4% *Bacillus* NP5 was not significantly different, but it significantly higher than the 0% *Bacillus* NP5 ($P < 0.05$) treatment. Probiotic treatment had a higher value of hematocrit than 0% *Bacillus* NP5 ($P < 0.05$). Supplementation of 1.1-1.2% *Bacillus* NP5 results in higher leukocytes than other treatments ($P < 0.05$). The highest phagocytes index was obtained from 1.2% *Bacillus* NP5 ($P < 0.05$). The lowest survival rate was at 0% *Bacillus* NP5 treatment in weeks 1 and 2 (Figure 1). The highest survival rate after *A. hydrophila* infection was obtained from 1.2% *Bacillus* NP5 treatment, namely 75.46% and 66.67% in weeks 1 and 2, respectively.

Discussion

Bacteria of the genus *Bacillus* have long been used as probiotics in aquaculture with numerous beneficial effects on their hosts, such as increasing growth performance, enhancing feed digestibility, the production of exogenous enzymes, enhancing immunity against pathogens, and stimulating microbiota populations to inhibit pathogenic colonization (Kuebutornye et al. 2019; RingØ 2020). The high activity of digestive enzymes indicates an increase in the development of the intestine of fish and its ability to digest feed (Darafsh et al. 2019). According to Dawood and Khosio (2016), protease, lipase, and amylase are the main enzymes responsible for feed digestion in the digestive tract of fish. This study showed that *Bacillus* NP5 supplementation increased protease activity, amylase, and lipase in the intestine of catfish compared to controls, especially at doses of 1.1-1.3%. It increases is due to the production of exoenzyme by probiotics. Sankar et al. (2016) reported that the high activity of digestive enzymes in feed treated with probiotics is due to the exoenzyme production by probiotics and its stimulation to the digestive tract of the host. The results obtained in this research are in

line with the previous studies by Putra et al. (2015 and 2020b) that the administration of *Bacillus NP5* increases the activity of protease, lipase, and amylase enzymes in the digestive tract of the host. Similar results were found on *L. vannamei* (Zokaeifar et al. 2012; Zokaeifar et al. 2014), Javanese carp (Allameh et al. 2015), and tilapia (Midhun et al. 2019).

The results showed that supplementation of 1.1-1.2% *Bacillus NP5* increased nutrient digestibility compared to 0% *Bacillus NP5*. A study by Lin et al. (2004) showed that supplementation of *Bacillus* spp. increased the digestibility of dry matter and protein in white shrimp. Mohapatra et al. (2012) reported the same results, which showed that dietary

probiotics in feed significantly ($P < 0.05$) enhance dry matter, protein, and lipid digestibility compared to controls on the rearing of juvenile rohu, *Labeo rohita*. In this study, the supplementation of 1.2% *Bacillus NP5* significantly increased the digestibility of dry matter and protein ($P < 0.05$), which were considered to be related to the protease enzyme activity in 1.2% *Bacillus NP5* treatment. Meanwhile, increasing protease enzyme activity in probiotic treatment has been reported in other fish species, such as *Litopenaeus vannamei*, with the application of *LactoBacillus pentosus* AS13 (Zheng and Wang 2016) and rainbow trout with *L. plantarum* supplementation (Enferadi et al. 2018).

Figure 1. The survival rate of African catfish after *Aeromonas hydrophila* infection

The application of probiotics in feed has resulted in the increasing growth of fish and shrimp (Liu et al. 2017; Arani et al. 2019; Xie et al. 2019). Jang et al. (2019) stated that probiotics increase the growth of the host by improving the digestibility of the feed. The highest final weight, specific growth rate, and feed conversion ratio were obtained from 1.2% *Bacillus* NP5 treatment ($P < 0.05$) was considered to be associated with high nutrient digestibility due to increased enzyme activity. According to Wu et al. (2012), probiotic supplementation improves the digestion process of feed and the beneficial microbial population and digestive enzyme activity in the digestive tract of the host. These results were consistent with previous studies, which showed that probiotics have a positive effect on enzyme activity, feed digestibility, and growth performance in hybrid groupers (He et al. 2016), tilapia (Poolsawat et al. 2020), and *L. vannamei* (Tsai et al. 2019).

The results showed that the feed intake was the same for all treatments, indicating that *Bacillus* NP5 supplementation in the feed did not affect its palatability (Tantikitti 2014). Similar results were observed in tilapia (Elsabagh et al. 2018), juvenile olive flounder (Lee et al. 2019), and rainbow trout (Nargesi et al. 2019). Supplementation of 1.2-1.4% *Bacillus* NP5 increased crude protein and lipids in the body composition of African catfish. It was consistent with the results obtained in several other species, such as goldfish, by administering *L. delbrueckii* (Zhang et al. 2018) and *L. vannamei* through the use of *B. subtilis* and *B. licheniformis* (Madani et al. 2018). Increasing protein and lipids in the body composition can be caused by the increased digestibility and food absorption of feed. As a result, there were more protein and fat deposits in the body (Abdel-Tawwab et al. 2008; Reda and Selim 2015). The results showed no difference in moisture and ash content in all treatments ($P > 0.05$). Similar results were discovered in *L. vannamei* (Adel et al. 2017), parrotfish (Liu et al. 2017), and snakehead (Dai et al. 2018).

Several studies have reported that probiotic supplementation reduces the mortality rate of fish and improves its immune system against pathogens (Adel et al. 2017; He et al. 2017; Hassani et al. 2019). Dawood et al. (2016) stated that probiotic supplementations in feed positively affect fish blood profile. This study showed that the erythrocyte and hemoglobin number in African catfish decreased after the challenge test compared to the pre-challenge test. Olivier et al. (1981) stated that the decrease in erythrocyte and hemoglobin is related to the ability of pathogens to damage red blood cells. A study by Kumar et al. (2015) showed that the number of erythrocytes and hemoglobin in *Catla* fingerling after experiencing a challenge test with *A. hydrophila* bacteria was decreased. The hematocrit number was the ratio of erythrocyte to total blood volume influenced by the number of cells (Soltani et al. 2017). In this study, the hematocrit value obtained by probiotic treatment was higher before and after pathogenic bacterial infection compared to those without probiotics. This result indicates that probiotic has improved the

immune system of African catfish. Hematocrit value is related to health status of fish (Nandi et al. 2017) and administration probiotics stimulated the innate immunity of fish (Adorian et al. 2018). The same results demonstrated by Ahmadifar et al. (2020) who reported the addition of probiotic *Pediococcus pentosaceus* 10^8 - 10^9 CFU g^{-1} increased the general hematocrit value compared to the controls in carp. Zhu et al. (2019) also reported that the hematocrit value in tilapia given probiotic *B. subtilis* LT3-1 was increased compared to the controls.

In this study, *Bacillus* NP5 supplementation in feed significantly increased leukocytes after infection with *A. hydrophila*. These results were in line with the study carried out by Reda and Selim (2015) that supplementation of *B. amyloliquefaciens* increased the leukocyte of Nile tilapia. A study by Pourgholam et al. (2017) showed that the addition of *L. plantarum* as a probiotic increased the leukocyte number in juvenile Siberian sturgeon. The leukocyte was one of the fish's non-specific defense systems (Uribe et al. 2011). The increase in fish leukocytes was related to the body's defense system response to disease infections (Tanbiyaskur et al. 2015). Phagocytes have been widely used to determine the defense against pathogenic infections (Giri et al. 2012). Tamamdusturi et al. (2016) stated that phagocytosis is the initial cellular immune system after a pathogenic infection was provided by monocytes and granulocytes. According to Djauhari et al. (2016), probiotic supplementation increases the cellular immune system of fish and increasing its resistance to pathogenic infections. The phagocyte index of African catfish increased significantly in the treatment of *Bacillus* NP5 after the challenge test. This result was similar to the result of a study by Doan et al. (2015) on *Pangasius* catfish that was challenged with *A. hydrophila* and Zhao et al. (2019) on giant freshwater prawns given *B. pumilus* probiotic.

The increase in blood profile values, especially the leukocytes and phagocyte index in probiotic treatment, indicated an increase in the immune system of African catfish. It was confirmed by increasing the survival rate after the challenge test with *A. hydrophila* at the *Bacillus* NP5 treatments. The results showed that *Bacillus* NP5 supplementation increased African catfish' resistance to *A. hydrophila* infection and increased their survival rate compared to treatment without probiotics. It implies that *Bacillus* NP5 supplementation increases the cellular and humoral defenses of African catfish. Similar results were also reported by Zokaeifar et al. (2012), with the addition of *B. subtilis* in the feed, which was used to increase the survival rate of *L. vannamei* infected with *V. harveyi*. This is also in accordance with the result in freshwater prawn through the addition of *B. licheniformis* in the feed (Kumar et al. 2013), *Cyprinus carpio* with administration *L. delbrueckii* (Zhang et al. 2017), and white shrimp with *Pediococcus pentosaceus* supplementation in the diet (Adel et al. 2017).

In conclusion, dietary *Bacillus* NP5 supplement positively increased the growth, immune response, and resistance of African catfish against *A. hydrophila* infection

with the optimal dose of *Bacillus* NP5 supplementation in the feed of African catfish was 1.2%.

ACKNOWLEDGEMENTS

The authors express gratitude to LPPM-UNTIRTA for funding this study through the research internal grant scheme of Penelitian Terapan Internal 2020 (Nomor: B/135/UN.43.9/PT.01.03/2020).

Vol. 22 No. 1 (2021)

Full Issue

Front Cover (<https://smujo.id/biodiv/issue/view/286/139>)

Articles

The ultrastructure changes of *Haemonchus contortus* exposed to bamboo leaves (*Gigantochloa apus*) aqueous extract under in vitro condition
(<https://smujo.id/biodiv/article/view/6911>)

BUDI PURWO WIDIARSO, WISNU NURCAHYO, KURNIASIH, JOKO PRASTOWO

PDF (<https://smujo.id/biodiv/article/view/6911/4473>)

Documentation of medicinal plants used by Aneuk Jamee tribe in Kota Bahagia Sub-district, South Aceh, Indonesia (<https://smujo.id/biodiv/article/view/7086>)

ADI BEJO SUWARDI, MARDUDI, ZIDNI ILMAN NAVIA, BAIHAQI, MUNTAHA

PDF (<https://smujo.id/biodiv/article/view/7086/4474>)

Ganoderma diversity from smallholder oil palm plantations in peatlands of Kampar District, Indonesia based on mycelia morphology and somatic incompatibility (<https://smujo.id/biodiv/article/view/7079>)

ANTHONY HAMZAH, RACHMAD SAPUTRA, FIFI PUSPITA, BESRI NASRUL, IRFANDRI, NOVITA SARI DEPARI

PDF (<https://smujo.id/biodiv/article/view/7079/4475>)

Level of lead contamination in the blood of Bali cattle associated with their age and geographical location (<https://smujo.id/biodiv/article/view/6792>)

I KETUT BERATA, NI NYOMAN WERDI SUSARI, I WAYAN SUDIRA, KADEK KARANG AGUSTINA

PDF (<https://smujo.id/biodiv/article/view/6792/4476>)

Aquatic insect communities in headwater streams of Ciliwung River watershed, West Java, Indonesia (<https://smujo.id/biodiv/article/view/6932>)

WAKHID, AUNU RAUF, MAJARIANA KRISANTI, I MADE SUMERTAJAYA, NINA MARYANA

PDF (<https://smujo.id/biodiv/article/view/6932/4477>)

The potential of amylase enzyme activity against bacteria isolated from several lakes in East Java, Indonesia (<https://smujo.id/biodiv/article/view/6855>)

INDAH KHOIRUN NISA, SITORESMI PRABANINGTYAS, BETTY LUKIATI, RINA TRITURANI SAPTAWATI, ACHMAD RODIANSYAH

PDF (<https://smujo.id/biodiv/article/view/6855/4478>)

Biodiversity and phylogenetic analyses using DNA barcoding *rbcl* gene of seagrass from Sekotong, West Lombok, Indonesia (<https://smujo.id/biodiv/article/view/7027>)

STEVANUS, MADE PHARMAWATI

PDF (<https://smujo.id/biodiv/article/view/7027/4479>)

Short communication: Physiological response to drought in North Sulawesi (Indonesia) local rice (*Oryza sativa*) cultivars at the tissue level in hydroponic culture (<https://smujo.id/biodiv/article/view/7099>)

SONG AI NIO, RISA JUNITA MEREH, DANIEL PETER MANTILEN LUDONG

PDF (<https://smujo.id/biodiv/article/view/7099/4480>)

Short Communication: Species composition and diversity of vegetation in dryland agricultural landscape (<https://smujo.id/biodiv/article/view/6787>)

IDA ARDIYANINGRUM, MARIA THERESIA SRI BUDIASTUTI, KOMARIAH

PDF (<https://smujo.id/biodiv/article/view/6787/4482>)

Der p 1 gene sequence polymorphism in house dust mite *Dermatophagoides pteronyssinus* (<https://smujo.id/biodiv/article/view/7049>)

ARYANI ADJI, NURDJANNAH J. NIODE, VENTJE V. MEMAH, JIMMY POSANGI, GRETA J. P. WAHONGAN, TRINA E. TALLEI

PDF (<https://smujo.id/biodiv/article/view/7049/4481>)

Short Communication: The bioinformatics perspective of *Foeniculum vulgare* fruit's bioactive compounds as natural anti-hyperglycemic against alpha-glucosidase (<https://smujo.id/biodiv/article/view/7064>)

FATCHUR ROHMAN, WIRA EKA PUTRA

PDF (<https://smujo.id/biodiv/article/view/7064/4483>)

Short Communication: Characterization and nutrient analysis of seed of local cowpea (*Vigna unguiculata*) varieties from Southwest Maluku, Indonesia (<https://smujo.id/biodiv/article/view/7230>)

R. L. KARUWAL, SUHARSONO, A. TJAHOLEKSONO, N. HANIF

PDF (<https://smujo.id/biodiv/article/view/7230/4484>)

Soil mesofauna amount and diversity by returning fresh and compost of crops biomass waste in ultisols in-situ (<https://smujo.id/biodiv/article/view/7031>)

JUNITA BARUS, DIAN MEITHASARI, JAMALAM LUMBANRAJA, HAMIM SUDARSONO, KUSWANTA FUTAS HIDAYAT, DERMIYATI

PDF (<https://smujo.id/biodiv/article/view/7031/4485>)

Development of monospecific polyclonal antibodies against hypervirulent *Klebsiella pneumoniae* (<https://smujo.id/biodiv/article/view/7224>)

DARNIATI, SURACHMI SETIYANINGSIH, DEWI RATIH AGUNGPRIYONO, EKOWATI HANDHARYANI

PDF (<https://smujo.id/biodiv/article/view/7224/4486>)

The structure and composition of macrozoobenthos community in varying water qualities in Kalibaru Waters, Bengkulu, Indonesia (<https://smujo.id/biodiv/article/view/6879>)

LILISTI, ZAMDIAL, DEDE HARTONO, BIENG BRATA, MARULAK SIMARMATA

PDF (<https://smujo.id/biodiv/article/view/6879/4487>)

The morphological characters and DNA barcoding identification of sweet river prawn *Macrobrachium esculentum* (Thallwitz, 1891) from Rongkong watershed of South Sulawesi, Indonesia (<https://smujo.id/biodiv/article/view/6685>)

JURNIATI, DIANA ARFIATI, SAPTO ANDRIYONO, ASUS MAIZAR SURYANTO HERTIKA, ANDI KURNIAWAN, WENDY ALEXANDER TANOD

PDF (<https://smujo.id/biodiv/article/view/6685/4488>)

Socio-ecological dimensions of agroforestry called kebun campuran in tropical karst ecosystem of West Java, Indonesia (<https://smujo.id/biodiv/article/view/7251>)

PARIKESIT, SUSANTI WITHANINGSIH, FAKHRUR ROZI

PDF (<https://smujo.id/biodiv/article/view/7251/4489>)

Microbiological, physical and chemical properties of joruk (fermented fish product) with different levels of salt concentration (<https://smujo.id/biodiv/article/view/7167>)

DYAH KOESOEMAWARDANI, LULU ULYA AFIFAH, NOVITA HERDIANA, A.S. SUHARYONO, ESA GHANIM FADHALLAH, MAHRUS ALI

PDF (<https://smujo.id/biodiv/article/view/7167/4490>)

Physicochemical and functional properties of spineless, short-spines, and long-spines sago starch (<https://smujo.id/biodiv/article/view/6646>)

BUDI SANTOSO, ZITA LETVIANY SARUNGALLO, ANGELA MYRRA PUSPITA

PDF (<https://smujo.id/biodiv/article/view/6646/4491>)

Assessment of mangrove species diversity in Banaybanay, Davao Oriental, Philippines (<https://smujo.id/biodiv/article/view/7085>)

BRIAN L. POTOTAN, NEIL C. CAPIN, AILEEN GRACE D. DELIMA, ANNABELLE U. NOVERO

PDF (<https://smujo.id/biodiv/article/view/7085/4492>)

Procruste analysis of forewing shape in two endemic honeybee subspecies *Apis mellifera intermissa* and *A. m. sahariensis* from the Northwest of Algeria (<https://smujo.id/biodiv/article/view/6969>)

FOUZIA ABED, BENABDELLAH BACHIR-BOUIADJRA, LAHOUARI DAHLOUM, ABDULMOJEED YAKUBU, AHMED HADDAD, ABDELKADER HOMRANI

PDF (<https://smujo.id/biodiv/article/view/6969/4494>)

Molecular analysis of Taro and Bali cattle using cytochrome oxidase subunit I (COI) in Indonesia (<https://smujo.id/biodiv/article/view/6948>)

NI NYOMAN WERDI SUSARI, PUTU SUASTIKA, KADEK KARANG AGUSTINA

PDF (<https://smujo.id/biodiv/article/view/6948/4495>)

Urbanization level and its effect on the structure and function of homegarden (pekarangan) vegetation in West Java, Indonesia (<https://smujo.id/biodiv/article/view/6949>)

MUHAMMAD SADDAM ALI, HADI SUSILO ARIFIN, NURHAYATI

PDF (<https://smujo.id/biodiv/article/view/6949/4496>)

Genetic diversity and relationship of husk tomato (*Physalis* spp.) from East Java Province revealed by SSR markers (<https://smujo.id/biodiv/article/view/7130>)

HALIMATUS SADIYAH, SUMERU ASHARI, BUDI WALUYO, ANDY SOEGIANTO

PDF (<https://smujo.id/biodiv/article/view/7130/4497>)

Species diversity and phenetic relationship among accessions of api-api (*Avicennia* spp.) in Java based on morphological characters and ISSR markers (<https://smujo.id/biodiv/article/view/6456>)

FENNALIA PUTRI SABDANAWATY, PURNOMO, BUDI SETIADI DARYONO

PDF (<https://smujo.id/biodiv/article/view/6456/4498>)

Diversity of macro fungus across three altitudinal ranges in Lore Lindu

National Park, Central Sulawesi, Indonesia and their utilization by local residents (<https://smujo.id/biodiv/article/view/6899>)

Y. YUSRAN, E. ERNIWATI, D. WAHYUNI, R. RAMADHANIL, A. KHUMAIDI

PDF (<https://smujo.id/biodiv/article/view/6899/4499>)

Updating of Makiling Biodiversity Information System (MakiBIS) and Analysis of Biodiversity Data (<https://smujo.id/biodiv/article/view/6929>)

DAMASA B. MAGCALE-MACANDOG, FERMIN ROBERTO G. LAPITAN, JEOFFREY M. LARUYA, JANDREL IAN F. VALERIO, JANZEN CHRISTIAN D. AGUILA, CLOUIE ANN L. MESINA, TWINKLE MARIE F. SANTOS, ANDREA NICOLE T. CUEVAS, KIMBERLY D. BAYLON, IANA MARIENE SILAPAN, RICAJAY DIMALIBOT, JENNIFER D. EDRIAL, NETHANEL JIREH A. LARIDA, FATIMA A. NATUEL, MA. GRECHELLE LYN D. PEREZ, SARENA GRACE L. QUINONES

PDF (<https://smujo.id/biodiv/article/view/6929/4500>)

Short Communication: Acute toxicity study of plantaricin from *Lactobacillus plantarum* S34 and its antibacterial activity (<https://smujo.id/biodiv/article/view/6083>)

ARIDO YUGOVELMAN AHADDIN, SRI BUDIARTI, A. ZAENAL MUSTOPA, HUDAS. DARUSMAN, LITA TRIRATNA

PDF (<https://smujo.id/biodiv/article/view/6083/4501>)

Diversity and distribution of figs (*Ficus*: Moraceae) in Gianyar District, Bali, Indonesia (<https://smujo.id/biodiv/article/view/7073>)

I MADE SAKA WIJAYA, MADE RIA DEFIANI

PDF (<https://smujo.id/biodiv/article/view/7073/4502>)

Mangrove associated macrobenthos community structure from an estuarine island (<https://smujo.id/biodiv/article/view/6662>)

MD. HABIBUR RAHMAN, M. BELAL HOSSAIN, AHASAN HABIB, MD. ABU NOMAN, SHUVAGATO MONDAL

PDF (<https://smujo.id/biodiv/article/view/6662/4503>)

Dietary *Bacillus* NP5 supplement impacts on growth, nutrient digestibility, immune response, and resistance to *Aeromonas hydrophila* infection of African catfish, *Clarias gariepinus* (<https://smujo.id/biodiv/article/view/6922>)

ACHMAD NOERKHAERIN PUTRA, MUSTAHAL, MAS BAYU SYAMSUNARNO, DODI HERMAWAN, DEVIA GUSNUR FATIMAH, PRAMODITA BALITA PUTRI, SEVIA, RINA ISNAINI,

MUHAMAD HERJAYANTO

PDF (<https://smujo.id/biodiv/article/view/6922/4504>)

Bird community structure as a function of habitat heterogeneity: A case of Mardi Himal, Central Nepal (<https://smujo.id/biodiv/article/view/6972>)

NARESH PANDEY, LAXMAN KHANAL, NEETI CHAPAGAIN, K. DEEPAK SINGH, BISHNU P. BHATTARAI, MUKESH KUMAR CHALISE

PDF (<https://smujo.id/biodiv/article/view/6972/4505>)

Conservation status of large mammals in protected and logged forests of the greater Taman Negara Landscape, Peninsular Malaysia (<https://smujo.id/biodiv/article/view/6727>)

GOPALASAMY REUBEN CLEMENTS, SUSANA ROSTRO-GARCÍA, JAN F. KAMLER, SONG HORNG LIANG, ABDUL KADIR BIN ABU HASHIM

PDF (<https://smujo.id/biodiv/article/view/6727/4508>)

Birds in the west coast of South Kalimantan, Indonesia (<https://smujo.id/biodiv/article/view/7268>)

MAULANA KHALID RIEFANI, MOCHAMAD ARIEF SOENDJOTO

PDF (<https://smujo.id/biodiv/article/view/7268/4509>)

Richness and diversity of insect pollinators in various habitats around Bogani Nani Wartabone National Park, North Sulawesi, Indonesia (<https://smujo.id/biodiv/article/view/7169>)

RONI KONERI, MEIS J. NANGOY, WAKHID

PDF (<https://smujo.id/biodiv/article/view/7169/4510>)

Diversity of biocontrol agents, isolated from several sources, inhibitory to several fungal plant pathogens (<https://smujo.id/biodiv/article/view/7198>)

YAN RAMONA, IDA BAGUS GEDE DARMAYASA, ANAK AGUNG NGURAH NARA KUSUMA, MARTIN A. LINE

PDF (<https://smujo.id/biodiv/article/view/7198/4511>)

Presence of multidrug resistance (MDR) and extended-spectrum beta-lactamase (ESBL) of Escherichia coli isolated from cloacal swab of broilers in several wet markets in Surabaya, Indonesia

(<https://smujo.id/biodiv/article/view/7247>)

MUSTOFA HELMI EFFENDI, WIWIEK TYASNINGSIH, YEMIMA ANGGUN YURIANTI, JOLA RAHMAHANI, NENNY HARIJANI, HANI PLUMERIASTUTI

PDF (<https://smujo.id/biodiv/article/view/7247/4512>)

Population, distribution, and habitat of Bornean Elephant in Tulin Onsoi, Nunukan District, Indonesia based on dung counts
(<https://smujo.id/biodiv/article/view/5053>)

WISHNU SUKMANTORO, AGUS SUYITNO, MULYADI, DONI GUNARYADI, AGANTO SENO, ALFRED INDRA KUSUMA, DARWIS

PDF (<https://smujo.id/biodiv/article/view/5053/4513>)

Acclimating leaf celery plant (*Apium graveolens*) via bottom wet culture for increasing its adaptability to tropical riparian wetland ecosystem
(<https://smujo.id/biodiv/article/view/6832>)

BENYAMIN LAKITAN, KARTIKA KARTIKA, SUSILAWATI, ANDI WIJAYA

PDF (<https://smujo.id/biodiv/article/view/6832/4514>)

Short Communication: Wildlife species used as traditional medicine by local people in Indonesia (<https://smujo.id/biodiv/article/view/7337>)

ANI MARDIASTUTI, BURHANUDDIN MASY'UD, LIN N. GINOGA, HAFIYYAN SASTRANEGARA, SUTOPO

PDF (<https://smujo.id/biodiv/article/view/7337/4515>)

Assessment of some heavy metals in various aquatic plants of Al-Hawizeh Marsh, southern of Iraq (<https://smujo.id/biodiv/article/view/7012>)

DUNYA A.H. AL-ABBAWY, BASIM M. HUBAIN AL-THAHAIBAWI, ITHAR K.A. AL-MAYALY, KADHIM H. YOUNIS

PDF (<https://smujo.id/biodiv/article/view/7012/4520>)

The influence of environmental factors on the distribution and composition of plant species in Oued Charef dam, northeast of Algeria
(<https://smujo.id/biodiv/article/view/7215>)

NAOUEL MOUALKI, NADHRA BOUKROUMA

PDF (<https://smujo.id/biodiv/article/view/7215/4521>)

Shewanella baltica strain JD0705 isolated from the mangrove wetland soils in Thailand and characterization of its ligninolytic performance (<https://smujo.id/biodiv/article/view/7252>)

AIYA CHANTARASIRI

PDF (<https://smujo.id/biodiv/article/view/7252/4522>)

Utilization of plant resources among the Kankanaeys in Kibungan, Benguet Province, Philippines (<https://smujo.id/biodiv/article/view/7516>)

ABIGAIL T. BERSAMIN, JUDE L. TAYABEN, KRYSSA D. BALANGCOD, ASHLYN KIM D. BALANGCOD, AMELIA C. CENDANA, ELIZABETH T. DOM-OGEN, LANCE OLIVER C. LICNACHAN, BRENILYN SIADTO, FREDA M. WONG, TEODORA D. BALANGCOD

PDF (<https://smujo.id/biodiv/article/view/7516/4525>)

Antibacterial potential of symbiont bacteria of brown algae (*Turbinaria conoides*) obtained from Indonesian waters (<https://smujo.id/biodiv/article/view/6910>)

NIKEN DHARMAYANTI, ARMA ANTI, RESMI RUMENTA SIREGAR, YULIATI H. SIPAHUTAR, AEF PERMADI, ARPAN NASRI SIREGAR, RANDI BOKHI SALAMPESY, SUJULIYANI, SITI ZACHRO NURBANI, HENI BUDI PURNAMASARI

PDF (<https://smujo.id/biodiv/article/view/6910/4524>)

Flowering and fruit quality characteristics in some seeded and seedless pummelo cultivars (<https://smujo.id/biodiv/article/view/7082>)

UMMU KALSUM, SLAMET SUSANTO, AHMAD JUNAEDI, NURUL KHUMaida, HENI PURNAMAWATI

PDF (<https://smujo.id/biodiv/article/view/7082/4526>)

Ethnobotanical study of medicinal plants used for maintaining stamina in Madura ethnic, East Java, Indonesia (<https://smujo.id/biodiv/article/view/7078>)

AKHMAD FATHIR, MOCH. HAIKAL, DIDIK WAHYUDI

PDF (<https://smujo.id/biodiv/article/view/7078/4527>)

Drought tolerance selection of GT1 rubber seedlings with the addition of polyethylene glycol (PEG) 6000 (<https://smujo.id/biodiv/article/view/7168>)

SYARIFAH AINI PASARIBU, MOHAMMAD BASYUNI, EDISON PURBA, YAYA HASANAH

PDF (<https://smujo.id/biodiv/article/view/7168/4528>)

Riparian plant diversity in relation to artisanal mining sites in Cikidang River, Banten, Indonesia (<https://smujo.id/biodiv/article/view/7240>)

NOVERITA DIAN TAKARINA, IKA LINA SINAGA, TRI RIFQOH KULTSUM

PDF (<https://smujo.id/biodiv/article/view/7240/4529>)

The potency of *Sansevieria trifasciata* and *S. cylindrica* leaves extracts as an antibacterial against *Pseudomonas aeruginosa* (<https://smujo.id/biodiv/article/view/7324>)

WHIKA FEBRIA DEWATISARI, LAURENTIUS HARTANTO NUGROHO, ENDAH RETNANINGRUM, YEKTI ASIH PURWESTRI

PDF (<https://smujo.id/biodiv/article/view/7324/4530>)

Local snake fruit conservation in East Java, Indonesia: Community knowledge and appreciation (<https://smujo.id/biodiv/article/view/7170>)

NOVITA K. INDAH, SERAFINAH INDRIYANI, ESTRI LARAS ARUMINGTYAS, RODIYATI AZRIANINGSIH

PDF (<https://smujo.id/biodiv/article/view/7170/4531>)

Effects of *Caulerpa lentillifera* added into culture media on the growth and nutritional values of *Phronima pacifica*, a natural fish-feed crustacean (<https://smujo.id/biodiv/article/view/7136>)

VIVI ENDAR HERAWATI, PINANDOYO, RESTIANA WISNU ARIYATI, NURMANITA RISMANINGSIH, SETO WINDARTO, SLAMET BUDI PRAYITNO, Y.S. DARMANTO, OCKY KARNA RADJASA

PDF (<https://smujo.id/biodiv/article/view/7136/4532>)

Endophytic bacteria associated with rice roots from suboptimal land as plant growth promoters (<https://smujo.id/biodiv/article/view/7149>)

NUR PRIHATININGSIH, HERU ADI DJATMIKO, PUJI LESTARI

PDF (<https://smujo.id/biodiv/article/view/7149/4533>)

Potential analysis of location, socio-culture and biodiversity as ecotourism attraction in Valentine Bay on Buano Island, West Seram, Maluku, Indonesia (<https://smujo.id/biodiv/article/view/7255>)

MARTHA E. SIAHAYA, PAULUS MATIUS, MARLON I. AIPASSA, YAYA RAYADIN, YOSEP RUSLIM, HENDRIK S.E.S. APONNO

PDF (<https://smujo.id/biodiv/article/view/7255/4534>)

Short Communication: Molecular bird sexing on kutilang (*Pycnonotus* sp.) based on amplification of CHD-Z and CHD-W genes by using polymerase chain reaction method (<https://smujo.id/biodiv/article/view/6955>)

YUDITH VIOLETTA PAMULANG, ARIS HARYANTO

PDF (<https://smujo.id/biodiv/article/view/6955/4535>)

Status of biodiversity in wetlands of Biswanath District of Assam, India (<https://smujo.id/biodiv/article/view/7317>)

RANJIT KAKATI, ABHISHEK BHUYAN, DIPANKAR BORAH
